The Americans with Disabilities Act (ADA) requires health care services to be accessible to hard-of-hearing people. Effective communication is critical to making your services accessible and often requires accommodations. Effective communication means that the hard-of-hearing person can participate in the information exchange to the same extent as a person who has no hearing loss.

**What You Need to Know:**

- Most hard-of-hearing people do not use sign language, but do need communication accommodations in order to receive quality health care.
- Always face the hard-of-hearing person when communicating with her to maximize visual and auditory information.
- Accommodations must be individualized for each person as needs vary significantly with each person and situation.
- Situations that require effective communication include:
  - describing health symptoms and medical conditions;
  - discussing medical history and medications;
  - explaining diagnoses, treatment options, and prognoses.
- Just writing questions and information down is rarely enough to communicate effectively.
- Trust the hard-of-hearing person to know how best to ensure effective communication and respect her specific accommodation request.
- Accommodations can be assistive listening devices, such as a personal FM system, or computer assisted real-time captioning (CART).
- Under the ADA, providers are responsible for the cost of accommodations.
